An authorised reissue of  
the long out of print  
classic textbook,

Advanced Calculus by  
the late Dr Lynn

Loomis and Dr Shlomo  
Sternberg both of

Harvard University has  
been a revered but hard  
to find textbook for the  
advanced calculus

course for decades. This  
book is based on an

honors course in  
advanced calculus that  
the authors gave in the  
1960's. The

foundational material,  
presented in the  
unstarred sections of  
Chapters 1 through 11,  
was normally covered,  
but different  
applications of this basic  
material were stressed  
from year to year, and  
the book therefore

contains more material than was covered in any one year. It can accordingly be used (with omissions) as a text for a year's course in advanced calculus, or as a text for a three-semester introduction to analysis. The prerequisites are a good grounding in the calculus of one variable from a mathematically

rigorous point of view,  
together with some  
acquaintance with linear  
algebra. The reader  
should be familiar with  
limit and continuity type  
arguments and have a  
certain amount of  
mathematical  
sophistication. As  
possible introductory  
texts, we mention  
Differential and Integral  
Calculus by R Courant,

Calculus by M Spivak,  
Applications  
and Pure Mathematics  
Hildebrand  
by G Hardy. The reader  
Solution Manual  
should also have some  
experience with partial  
derivatives. In overall  
plan the book divides  
roughly into a first half  
which develops the  
calculus (principally the  
differential calculus) in  
the setting of normed  
vector spaces, and a

second half which deals with the calculus of differentiable manifolds.

Advanced Calculus is

intended as a text for courses that furnish the backbone of the student's undergraduate education in mathematical analysis.

The goal is to rigorously present the fundamental concepts within the

context of illuminating  
examples and  
stimulating exercises.

This book is self-

contained and starts

with the creation of  
basic tools using the  
completeness axiom.

The continuity,  
differentiability,  
integrability, and power  
series representation  
properties of functions  
of a single variable are

established. The next few chapters describe the topological and metric properties of Euclidean space. These are the basis of a rigorous treatment of differential calculus (including the Implicit Function Theorem and Lagrange Multipliers) for mappings between Euclidean spaces and integration for functions

Special attention has been paid to the motivation for proofs.

equations, have been

included in such a way

that selections may be

essential material.
