There is a need for fundamental changes in the ways society views electric

Read Book Et Pricing

energy. Electric energy must be treated as a commodity which can be bought, sold, and traded, taking into account its time-and space-varying values and costs. This book presents a complete framework for the

Read Book Et Pricing

establishment of such an energy marketplace. The framework is based on the use of spot prices. In general terms:

- o An hourly spot price (in dollars per kilowatt hour) reflects the operating and capital costs

of generating, transmitting and distributing electric energy. It varies each hour and from place to place. o The spot price based energy marketplace involves a variety of utility-customer transactions (ranging from

Read Book Et Pricing

hourly varying prices to long-term, multiple-year contracts), all of which are based in a consistent manner on hourly spot prices. These transactions may include customers selling to, as well as buying from, the

utility. The basic theory and practical implementation issues associated with a spot price based energy marketplace have been developed and discussed through a number of different reports, theses,

and papers. Each addresses only a part of the total picture, and often with a somewhat different notation and terminology (which has evolved in parallel with our growing experience). This book was xvii xviii Preface

Why the traditional "pledge and review" climate agreements have failed, and how carbon pricing, based on trust and reciprocity, could succeed. After twenty-five years of failure, climate negotiations continue to use

Read Book Et Pricing

a "pledge and review"
approach: countries pledge
(almost anything), subject
to (unenforced) review. This
approach ignores everything
we know about human
cooperation. In this book,
leading economists describe

an alternate model for climate agreements, drawing on the work of the late Nobel laureate Elinor Ostrom and others. They show that a "common commitment" scheme is more effective than an "individual commitment"

scheme; the latter depends on altruism while the former involves reciprocity ("we will if you will"). The contributors propose that global carbon pricing is the best candidate for a reciprocal common commitment

in climate negotiations. Each country would commit to placing charges on carbon emissions sufficient to match an agreed global price formula. The contributors show that carbon pricing would facilitate

negotiations and enforcement, improve efficiency and flexibility, and make other climate policies more effective. Additionally, they analyze the failings of the 2015 Paris climate conference.

This monograph is devoted to the identification and measurement theory of costs and benefits in a fuzzy information environment. The

process of cost-benefit analysis is presented, requiring the development of real cost-benefit databases and the construction of cost-benefit criterion. These steps are accomplished with various theoretical

constructs that provide sets of self-contained algorithms for application. This book integrates cost-benefit analysis, theory of fuzzy decisions and social decisions into unified decision algorithms

Recent changes in the New South Wales water utilities show a trend towards usage-

related pricing, with the aim of providing efficient signals for consumption. This thesis evaluates alternative pricing strategies for water against the criteria of efficiency and equity while maintaining

the financial viability of the public utility. First, the water utility cost structure is examined by developing cost functions to estimate short and long-run marginal costs, using a quarterly time-series data

from 1970/71 to 1995/96.
Second, a residential water demand model is developed using a panel data set (constructed for the analysis), comprising 822 cross-sectional units and 23 quarterly time periods from

1990/91 to 1995/96. The purposes of developing the demand model are to test the sensitivity of water demand to changes in the tariff structure and to use it to simulate the impact of alternative pricing

strategies. Third, the simulation model is developed to analyse various pricing reforms using both the cost and demand model results, where the individual welfare and aggregate efficiency gains

Read Book Et Pricing

are determined under each pricing policy. In addition to this, the distributional effects of various tariff structures are examined. The empirical results of the cost structure estimates are comparable with previous

studies. The demand estimation indicates that consumers respond to price, therefore price can be considered as a tool in the implementation of demand management strategies. However, the magnitude of

Read Book Et Pricing

the price elasticity suggests that substantial increases in price would be required to influence demand. Finally, the simulation results show that in the case of movement from the actual tariff structure

to a two-part tariff policy (where the usage charge is equal to the short-run marginal cost), leads to highest efficiency gains.

During the last decade the European Commission has progressively adopted what is called a and 'more economic approachand' toward competition policy. This
