An essentially self-contained homotopy theory of filtered  $(A_\infty)$  algebras and  $(A_\infty)$  bimodules and applications of their obstruction-deformation theory to the Lagrangian Floer theory are presented. Volume II contains detailed studies of two of the main points of the foundation of the theory: transversality and orientation.

Historically, the representation theory of nite groups was developed with the same mo-tivation: Turning problems in group theory into problems in linear algebra. The study began with Cauchy and Dedekind's work in the early 1800s on what later became char-acter theory [Cau41, Ded85, Tau33]. However, Frobenius was the rst mathematician to

KEITH CONRAD Abstract. Representation theory was created by Frobenius about 100 years ago. We describe the background that led to the problem which motivated Frobenius to dene characters of a nite group and show how representation theory solves the problem. The rst results about representation theory in characteristic p are also discussed.
